

The missing piece of the puzzle

## What is ASC?

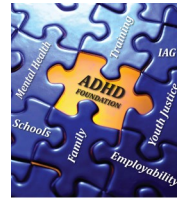

ASC (Autistic Spectrum Conditions) affect differences in reciprocal social interaction and communication.

Someone with autism finds it very difficult to understand the meaning of words or gestures. They cannot express their thoughts and desires and everything around them appears confusing. They can often behave in unusual or unpredictable ways, and can have rigid or repetitive behaviours.

Autism can affect all degrees of mental ability, from those with severe learning difficulties to those of above average intelligence.

**Please be patient**
