

The missing piece of the puzzle

What is Dyspraxia?

Dyspraxia (Developmental Coordination Disorder) affects a person's motor (movement) abilities. Children with dyspraxia lack the fine and gross motor skills to cope with many everyday activities, like fastening clothes, handwriting, painting, PE.

They may seem clumsy, be left out of peer games. They will lack confidence, avoid new activities fearing failure, and may be disruptive. They need: lots of help and encouragement especially with organisational or group tasks; easy or loose clothing (Velcro fasteners, short socks, V-necks). Physio or occupational therapy may help.

Please be patient
